

Abstract

Improvements relating to Combined Lancets and Caps

5 A lancet body (2) is integrally moulded with a cap (3)
for a firing device, the cap concealing the needle tip (5).
The cap (3) can be used to insert the lancet (1), which is
held while the cap is twisted off. The cap (3) is then
fitted to the firing device to provide an apertured
10 platform to be held against the skin and through which the
needle tip (5) will momentarily project. The cap (3) has
to be deformed to fit, and on being removed and recovering
its natural shape internal lugs (14) catch hold of the
released lancet (1) and remove that as well.
